

S.No	Requirement	User Impact	Feasibility	MoSCoW Category	Justification
1	Search books by title and author	High	High	Must-Have	Core library function that helps users find books quickly. It is practical to implement with a basic database search and is essential for a usable first version.
2	Online book reservation system	High	Medium	Must-Have	Allows users to reserve unavailable or desired books and improves access to library resources. It needs reservation rules and availability tracking, but is feasible for the first release.
3	Monthly reports on borrowed books for administrators	High	High	Should-Have	Helps administrators monitor borrowing activity and prepare summaries. Useful for management, but basic borrowing and return functions can operate before report automation is added.
4	Email notifications for overdue books	High	Medium	Should-Have	Reminds users to return books and helps reduce overdue loans. Email service setup and scheduled checks add work, so it can follow the core functions.
5	QR code scanning for borrowing and returning books	Medium	Medium	Could-Have	Can speed up circulation and reduce manual entry, but standard borrowing and return workflows can work without QR scanning. Device and scanner compatibility may add effort.
6	User-friendly dashboard for librarians	High	High	Must-Have	Librarians need a clear interface to manage books, members, loans, and returns. A simple dashboard is feasible and important for daily operations.
7	Allow users to review and rate books	Medium	High	Could-Have	Reviews can help readers choose books, but they are not necessary for core library operations. A basic rating feature is relatively feasible and can be added later.
8	Chatbot for user assistance	Medium	Medium	Could-Have	A chatbot may answer common questions and reduce staff workload, but it is not essential when normal help/contact options are available. Quality and integration require extra effort.
9	Mobile app version of the system	High	Low	Won't-Have (initial release)	A mobile app could improve convenience, but building and maintaining separate mobile applications increases time, cost, and testing needs. Defer it from the current release; a responsive website can be used instead.
10	Multi-language support	Medium	Medium	Could-Have	It can make the system more accessible to users who prefer different languages, but translation, interface testing, and ongoing maintenance add work. Start with one language and add others later.
